

ICI Toxicity Phenotype Decomposition: Four Non-Exchangeable Evidence Systems

Aggregate clinical source registry	Strict organ-specific irAE estimability	openFDA drug/event reporting signals	Patient-level PBMC molecular support
384 endpoint-labelled rows 36 source blocks 71 primary-compatible 313 sensitivity/audit/context	23 organ-by-grade strata 0/23 not estimable strict irAE mostly sparse or source-concentrated	80 exact agent-family rows 10 ICI agents; 8 families reporting-signal phenotype only not incidence or risk estimates	60 melanoma PBMC samples 21 severe; 39 grade 0-2 0 unadjusted FDR hits 0 therapy-adjusted FDR hits
Broad high-grade TRAE: lymphoma 19.1% solid 31.1% heterogeneous; sensitivity-only	Answers: which strict-irAE comparisons are not estimable from public aggregate data	Answers: which drug-event families are reported disproportionately	Answers: whether severe-irAE phenotypes are molecularly measurable in patient data

Dashed separators: evidence systems are not exchangeable. This is a conceptual schematic, not a results figure.
